**Status of Holography software**

- Near-real-time farside pipeline software is ready; 200x200 compressed images every minute produce daily farside maps
- Produced 108 farside images in non-real-time for long-term analysis
- Additional software to construct the full-hemisphere farside images has been tested and currently being implemented

**Analysis**

- *Gaps in data series could be the reason for linear shifts between MDI and GONG farside images*
- *Working on calibration of nearside acoustic images with nearside observations, we found strong dependence between magnetic field strength and phase shift*
